

ABSTRACT

1 The wireless human input device comprises at least one wireless human
2 transmitting unit and a wireless human receiving unit. The wireless human
3 transmitting unit generates leading signals and data signals and transmits the signals
4 to the wireless human receiving unit. The wireless human receiving unit receives all
5 the leading signals and identifies the data signals based on the leading signals so as
6 to distinguish the data signals being transmitted by which wireless human
7 transmitting unit transmitted.
